

A window into the early Universe

First-order phase transitions can leave a gravitational-wave signature.

The energy released sets the stage.

$$\alpha = \frac{\rho_{\text{vac}}}{\rho_{\text{rad}}}$$

A possible gravitational-wave signal

Illustrative spectra · arbitrary normalization

Three parameters, one signal

A compact language for the dynamics of a phase transition.

01 STRENGTH

$$\alpha = \frac{\rho_{\text{vac}}}{\rho_{\text{rad}}}$$

How much energy is released into the cosmic plasma?

02 DURATION

$$\frac{\beta}{H_*}$$

How rapidly does the transition complete?

03 TEMPERATURE

$$T_* \sim 100 \text{ GeV}$$

Which energy scale sets the characteristic peak?
